

Loom data flow — type split

Shared pipeline until we know what a document is. Then Loom's router fans out into different workflows. Paths rejoin for unit reports and Drive.

Shared trunk (everyone)

CODE

1. Sources land

Drop files into `projects/<id>/sources/` — mixed types, one pile.

CODE

2. Text extraction

`doc_extract.py` — shared for every file.

MODEL

3. Ingest

`ingest.py` — group into units + day calendars. Types not routed yet.

CODE

4. Rollup

`rollup.py` — pacing / year map from calendars.

MODEL

5. Layer 0 — decompose + classify

Extract cited elements and classify document type (lesson plan, quiz, slides, ...).

Ledger: `layer0/ledger.json`

Last shared step before Loom splits.

6. Loom router — split by type (planned)

`route.py` reads classification → picks a workflow. Unknown → general path + feedback log.

PATH A · LESSON PLAN

Lesson plan workflow

1. Layer 1 place on calendar (lesson-aware)
2. Hunter / CTAT checklist Layer 2
3. **Model assigns excerpts** → **Hunter fields** (fixes fill drift)
4. Emit `LESSON-PLAN.md/.pdf`

Out: lesson completeness + filled Hunter sheet

PATH B · QUIZ / ASSESSMENT

Quiz workflow

1. Answer key present?
2. Item coverage vs unit TEKS / learning targets
3. Formative vs summative on day grid
4. No Hunter plate — assessment-shaped findings

Out: quiz audit rows for teacher packet

PATH C · EVERYTHING ELSE

General pass

1. Slides, worksheets, rubrics, unknown...
2. Generic Layer 1–2 analysis
3. Log unknowns → `_loom_feedback.yaml`
4. Later: promote hot patterns to their own workflow

Out: generic findings + feedback for growth

↓ **paths rejoin per unit** ↓

HYBRID

7. Unit assemble

TEACHER-PACKET (auditor) · UNIT-PLAN (NW ISD macro) · LESSON-PLAN from Path A only

CODE

8. Drive push

Per-unit PDFs + files.

Where the model fills the lesson-plan sheet: on Path A only, after the document is typed as a lesson plan — not on the shared trunk, and not on quiz/general.
